

WeatherXL™ Silicone Polyester Coatings

Valspar's WeatherXL silicone polyester coatings are ideal for a variety of metal building applications including agricultural, industrial, commercial, and pre-engineered metal building components and systems.

These coatings provide the exterior color and gloss durability as well as the chalking and chemical resistance that is demanded by these markets through a unique chemistry that combines durable ceramic and other select inorganic pigments with a breakthrough, proprietary resin technology. Applicators and contractors will benefit from its superior abrasion resistance that allows WeatherXL silicone polyester coatings to endure the normal physical abuses that can occur in transit, application, and construction.

Valspar manufactures WeatherXL coatings in a wide range of standard colors. Many of these colors are formulated to meet ENERGY STAR®, LEED® and Title 24® guidelines for cool roofs. WeatherXL coatings can decrease the amount of money you spend on energy to cool the building. Valspar also offers a USDA compliant white upon special request for applications where incidental contact with food occurs. Custom colors are also available.
